

Pigeon vest

Summary: A pigeon vest is a bra-like garment designed to keep carrier pigeons safe during World War II. They were also known as pigeon bras.

Pigeons had previously been used in World War I, and parachutes were designed specifically for them. However, the pigeon vest was a new technology developed for use in World War II. In 1944, Maidenform was contracted to provide 28,500 pigeon vests to the United States Armed Forces. The fabric used in pigeon vests was tightly woven to prevent damage from their claws,...

A pigeon vest is a bra-like garment designed to keep carrier pigeons safe during World War II. They were also known as pigeon bras.

Pigeons had previously been used in World War I, and parachutes were designed specifically for them. However, the pigeon vest was a new technology developed for use in World War II. In 1944, Maidenform was contracted to provide 28,500 pigeon vests to the United States Armed Forces. The fabric used in pigeon vests was tightly woven to prevent damage from their claws, and only contained a pigeon's body, leaving their head and wings free. The devices contained adjustable straps so the pigeons could be more easily carried by paratroopers. Once they landed, the pigeon vest would be undone, and then the pigeon would fly to their homing base. Pigeons were used for messages because they were less likely to be intercepted by enemy forces. They had a 95% success rate.
